

THE BOARD MEETING SHOULD NOT BE A RECONSTRUCTION

Stop flying blind. Give the board one truth.

iProjectX is not a static register. It calculates project health, explains money and RAG, governs stage gates, and keeps every tenant isolated — Agile and Waterfall on the same spine.

8

6

Pulse areas

100%

MFA for every user

1

Truth · Agile & Waterfall

Sunday rebuild. Monday theatre. Tuesday surprise.

Leaders do not lack slides. They lack a live, explainable portfolio. By the time the pack is pretty, the money has already moved.

REGISTER THEATRE

RAG is typed by hand

Schedule, FAC, and risks already disagree. Someone still paints the chip green so the pack can go out.

STALE BOARD PACK

The deck is last month's weather

No pulse. No drivers. The first time an overrun is "seen" is at year-end reconciliation.

GATE THEATRE

Approvals live in email

Checklists optional. Evidence nowhere. RAID rotting in a shared workbook nobody opens in the meeting.

TALENT FOG

The same person is booked five times

Capacity is a conversation, not a number. Dependencies surface only when a successor is already late.

WHY THIS CATEGORY IS WON OR LOST

Registers record the past. Intelligence surfaces the next decision — before the board pack is late.

The buyer is not shopping for more columns. They are buying an early-warning system that can defend every red, every dollar, and every hold in the room.

See

This week's movement, not last quarter's story

Explain

Health and money that can speak for themselves

Decide

A gate, an ask, an owner — with evidence

See. Explain. Govern. Trust.

Four verbs. That is the whole product. Everything else is how those verbs stay true under pressure.

01 · SEE

Pulse + Cockpit

Event-driven portfolio health by area. Week-over-week digest. Attention cards instead of a 40-slide appendix.

02 · EXPLAIN

Health + money

Eight-dimension Project Health Engine. Explain This on forecast, spend, and budget. RAG bands: Green ≥ 80 , Amber 65–79, Red < 65 — unless a named override is set.

03 · GOVERN

Gates + RAID

Stage-gate approvals with checklist evidence. Risks, actions, issues, decisions tied to project, stream, and forum — not a side spreadsheet.

04 · TRUST

Tenant-hard

MFA for every user. Row-level isolation. Optional SSO, IP allowlists, and Bring-Your-Own-Database. In-house AI by default.

Health is calculated. RAG is earned.

Weighted across schedule, financials, scope, delivery, resources, risk, dependencies, and benefits. Early warnings and a 30-day outlook — not a traffic light someone chose in a panic.

Green ≥ 80

On the rails. Still watch the drivers.

Amber 65–79

Pressure is visible. Act this week.

Red < 65

The room needs a decision, not a colour.

Schedule 20%

Slip, gates, planned vs actual.

Financial 20%

FAC vs envelope, cashflow variance.

Delivery 15%

Work, phase, method-aware gates.

The rest 45%

Scope, people, risk, dependencies, benefits.

Show what changed. Then show why the number is the number.

PORTFOLIO PULSE

Six areas. One digest.

Financial, delivery, resources, risk, benefits, dependencies — with week-over-week movement. Leaders see what deteriorated, what improved, and what became overdue.

Cockpit: attention cards, scoreboard, health mix, FY money — filterable to the projects that person is allowed to see.

EXPLAINABLE KPIS

Money that can defend itself

Every material forecast and spend figure carries drivers: FAC versus approved envelope, monthly plan versus actual versus forecast, CapEx and OpEx, benefits promised versus realised.

The CFO should never have to ask “where did that come from?” in a public room.

Gates, RAID, and work — on the same truth.

STAGE GATES

Pass, hold, reject — with a checklist

Approvals become Decisions. Evidence stays with the gate. Method-aware flow: Waterfall and Agile do not get mashed onto one fake axis.

RAID

Not a side register

Risks, actions, issues, decisions tied to project, stream, forum, sponsor, and gate. Critical and overdue items escalate. Daily digests keep the queue moving.

PEOPLE + TIME

Plan, book, timesheet

Capacity heatmaps plus approved timesheet actuals. Demand intake scores work before it becomes a project. Jira can land in the funnel.

Governance is useless if it is a different system from delivery. iProjectX refuses that split.

Enterprise-hard by default. Optional where it must be.

IDENTITY

MFA for every user

Authenticator TOTP required. Optional per-organisation SAML SSO. Optional IP / CIDR allowlists.

ISOLATION

Row-level tenancy

Every organisation's registers stay isolated. Project Access grants scope pages, KPIs, and dropdowns — including Home.

RESIDENCY

Optional BYOD

Tenant data on your PostgREST-compatible database. Auth and control plane stay on iProjectX.

INTELLIGENCE

In-house AI first

Portfolio Q&A stays inside the org session. An approved Open AI model is off unless the organisation requests it.

BRAND

White-label ready

Logos, colours, auth experience, and themes per organisation. Their board should see their mark, not ours.

EVIDENCE

Audit, not theatre

Admin audit log, security events, one-click Excel evidence packs. Built for SOC 2 and ISO 27001 readiness — we do not claim a certificate we have not earned.

ONE PRODUCT. FOUR REASONS TO SAY YES.

WHO IS IN THE ROOM

Sell the job, not the module list.

PMO / HEAD OF DELIVERY

"I will not rebuild the pack on Sunday."

Pulse, cockpit, health, gates, RAID, and resources on one truth. Excel import if they still live in workbooks.

EXECUTIVE / SPONSOR

"Show me what needs a decision this week."

Attention cards, delay cascades, investment ranking. Scoped to the programs they actually own.

CFO / FINANCE PARTNER

"Defend the number."

Plan / actual / forecast, FY allocation capped to the envelope, CapEx / OpEx, benefits realisation scored into health.

CISO / RISK

"Do not leak the portfolio."

MFA, RLS, optional SSO / BYOD, in-house AI, audit evidence. Project-level visibility, not a shared login.

EXPRESSION OF INTEREST

Turn the portfolio into an intelligence advantage.

White-label ready. MFA-enforced. Optional SSO and BYOD. In-house AI by default. Deploy calculated health, Portfolio Pulse, explainable KPIs, and governed gates — not another spreadsheet register.

01

Walk their live pain on the cockpit — their scope, their programs

02

Leave the one-pager and the security sheet with the CISO

03
